## Braille touchpad

BrailleTouch is a smartphone application developed by Georgia Tech's researchers. It enables visually impaired people to write text messages simply by using six keys on the screen representing the Braille alphabet.

### Why it matters

New technology such as Apple's SIRI doesn't replace such a device. One can easily imagine that people would prefer the discretion of such an application in public places. Which new device or app could give physically disabled people a broader access to daily life tasks?
